1. What is Corpus Engine? {#what-is-corpus-engine}

Corpus Engine is a cloud-based, AI-powered media assistant designed specifically for **live church broadcasts**. It listens to what the preacher or worship leader is saying in real time, and automatically:

- **Detects Bible scripture references** and retrieves the full verse text instantly
- **Identifies worship songs** and fetches the complete lyrics from the internet
- **Pushes content directly** to your broadcast screens through Holyrics, vMix, or ProPresenter

Instead of a media team member scrambling to type scriptures while the preacher is speaking, Corpus Engine does all of this automatically — in under one second.

2. Why Corpus Engine? The Productivity Advantage {#why-corpus-engine}

The Problem: How Most Churches Operate Today

In a typical live broadcast setup, displaying a Bible verse on screen requires **three or more people** working together in a stressful, error-prone chain:

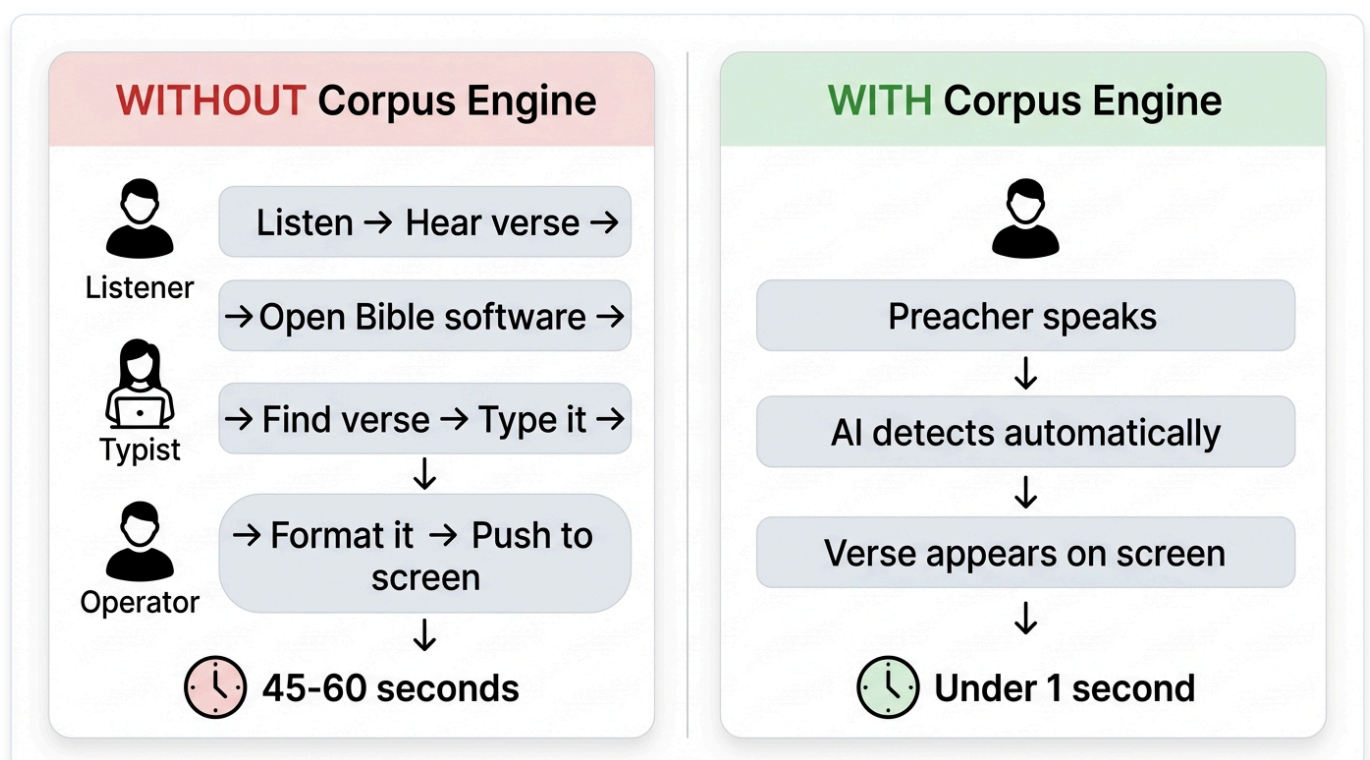

1. **The Listener** — Someone has to carefully listen to the preacher and catch the exact scripture reference
2. **The Typist** — Another person has to open Bible software, search for the verse, and type it out
3. **The Operator** — A third person formats the text and pushes it to the broadcast screen

This manual process typically takes **45 to 60 seconds** from the moment the preacher says a verse to when it finally appears on screen. By that time, the preacher has already moved on, and the congregation has missed the context.

The Solution: How Corpus Engine Works

With Corpus Engine, you need **just one person** (or even zero, with Auto-Push enabled):

1. The preacher says "Let us turn to John chapter 3, verse 16"
2. Corpus Engine's AI **instantly detects** the reference
3. The full verse text appears on your broadcast screen in **under 1 second**

Key Benefits at a Glance

Feature	Without Corpus Engine	With Corpus Engine
People needed for scripture display	2-3 people	1 person (or fully automatic)
Time to display a verse	45-60 seconds	Under 1 second
Missed verses during preaching	Very common	Almost never
Song lyrics during worship	Manual typing required	Auto-detected and fetched
Setup across multiple locations	Re-configure everything	Log in — settings sync from cloud
Training required	Extensive	Minimal — AI does the heavy lifting

Bottom Line: Corpus Engine doesn't just find scriptures faster — it **reduces your media workforce, eliminates human error**, and **enhances your broadcast productivity** dramatically. One person can now do the work that used to require three.

3. Getting Started: Registration & Account Setup {#getting-started}

Step 1: Open Google Chrome

Corpus Engine works best in **Google Chrome** browser. Open Chrome on your computer.

 **Important:** We strongly recommend Google Chrome. Other browsers like Firefox or Safari may not support the live audio features properly.

Step 2: Go to the Corpus Engine Website

Type this address into your browser:

You will see the Corpus Engine landing page with a beautiful dark interface.

Step 3: Create Your Account

1. Click the "**Start Your 7-Day Free Trial**" button (or "**Sign In**" if you already have an account)
2. Enter your **email address** and choose a **password**
3. Check your email inbox for a **verification link** and click it
4. Once verified, you will be redirected back to Corpus Engine and logged in automatically

Step 4: You're In!

After logging in, you will land on the **Corpus Engine Dashboard** — your central command centre for live broadcasts.

 **Cloud Sync:** All your settings are saved to the cloud. This means if you log into Corpus Engine from a different computer (for example, the church desktop), all your Holyrics IP addresses, vMix settings, and preferences will already be there waiting for you.

4. Understanding the Dashboard {#understanding-the-dashboard}

When you log in, you will see the main dashboard split into three columns:

Left Column: Live Transcript

This is where you see the **real-time text** of what the preacher is saying. As the microphone picks up audio, spoken words appear here live.

Centre Column: Staging Queue

This is the "waiting room" for content that Corpus Engine has detected. When it hears a scripture reference or a song, a **card** appears here. You can review the card and then click "**PUSH LIVE**" to send it to the broadcast screen. (Or, if Auto-Push is enabled, it goes straight to the screen automatically.)

Right Column: Program Output

This shows you a **live preview** of exactly what is currently being displayed on your broadcast screen.

Top Navigation Bar

At the very top of the screen, you will see a row of toggle buttons:

Button	What It Does
 Bible	Opens the full Bible browser (Ctrl + B)
 Lyrics	Opens the Lyrics browser to push saved songs (Ctrl + L)
 Start Session	Begins recording the session for review later
 Audio: ON/OFF	Turns the live microphone listening on or off
 AI: ON/OFF	Enables the AI engine for detecting paraphrased scriptures
 Captions: ON/OFF	Enables Spoken Word Mode (live subtitles)
 Push: ON/OFF	Enables Auto-Push (sends detected content straight to screen)
 Settings	Opens the full settings drawer
 Launch Output	Opens the output window on your projector/second monitor

5. Key Features Breakdown {#key-features}

Three-Tier Scripture Detection

Corpus Engine uses three layers of intelligence to catch scriptures, each one faster than the last:

Tier 1 — Lightning Regex (Instant, under 0.3 seconds) When the preacher says an explicit reference like *"John 3:16"* or *"Genesis chapter 1 verse 1"*, the system intercepts it with a pattern-matching engine immediately. No AI needed.

Tier 2 — Phrase-Based Search (~2 seconds) When the preacher quotes a verse without naming it (e.g., *"For God so loved the world..."*), Corpus Engine searches the entire Bible for the matching phrase and displays it with the correct reference.

Tier 3 — AI Semantic Fallback (~3 seconds) When the preacher paraphrases a verse loosely (e.g., *"That passage where Paul talks about running the race..."*), the AI engine analyses the

context and identifies the correct scripture (Hebrews 12:1).

Automatic Song Lyrics

When the worship team starts singing, Corpus Engine can detect the song title and automatically fetch the complete lyrics from the internet. The lyrics are broken into sections (Verse 1, Chorus, Bridge, etc.) so you can push them one section at a time.

Built-In Bible Browser

Press **Ctrl + B** to open a full Bible browser. Select any book, chapter, and verse. Click a verse to push it live instantly.

Lyrics Browser

Press **Ctrl + L** to open the Lyrics browser. All songs you've previously saved are listed here. Click a song to see its sections and push them live.

Live Translation

Enable translation in settings to automatically translate scriptures into another language (e.g., French, Yoruba, Spanish) and display both the original and translated text on screen.

Cloud-Synced Settings

Log in from any computer anywhere in the world — your settings, API keys, IP addresses, and preferences are all synced securely from the cloud.

6. PART A: Connecting Corpus Engine to Holyrics

{#connecting-to-holyrics}

This section walks you through **every single step** of connecting Corpus Engine to **Holyrics** so that when you push a scripture or lyric from Corpus Engine, it appears on the Holyrics projection screen automatically.

Understanding the Connection

Corpus Engine runs in your web browser (Chrome). Holyrics runs as a separate application on your computer. For them to talk to each other, Holyrics has a built-in "API" (think of it as a secret doorway) that allows other software to send it commands. We need to:

1. **Turn on** that doorway in Holyrics
2. **Get the keys** (the Port number and Token)

3. **Give those keys** to Corpus Engine in its Settings

Scenario A: Corpus Engine and Holyrics on the SAME Computer

If both Corpus Engine (in your Chrome browser) and Holyrics are running on the **same laptop or desktop**, the IP address you will use is:

127.0.0.1

This is a special address that means "this computer" (also called "localhost").

Scenario B: Corpus Engine and Holyrics on DIFFERENT Computers

If Corpus Engine is running on Laptop A (for example, the media desk) and Holyrics is running on Laptop B (connected to the projector), you need to find the **IP address of Laptop B**. Here's how:

1. On **Laptop B** (the one running Holyrics), press the **Windows key + R**
2. Type `cmd` and press Enter
3. In the black Command Prompt window, type `ipconfig` and press Enter
4. Look for the line that says **IPv4 Address**. It will look something like `192.168.1.105`
5. Write this number down — this is the IP address you will enter in Corpus Engine

 **Important:** Both computers **MUST** be connected to the **same WiFi network** for this to work. If Laptop A is on a different WiFi than Laptop B, they cannot communicate.

Step-by-Step: Setting Up Holyrics API

(If you do not have Holyrics installed yet, you can download it for free from <https://holyrics.com.br/>)

Step 1: Open Holyrics Settings

1. Open Holyrics on your computer
2. Click **File** in the top menu bar
3. Click **Settings** from the dropdown menu

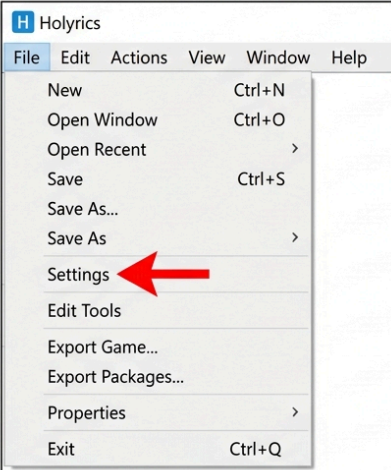

Step 2: Navigate to the API/Web Tab

1. In the Settings window that opens, look for a row of tabs along the left or top
2. Click on the tab labelled **API/Web** (or simply **API**)
3. Click the **Edit** button in this panel to unlock the settings.

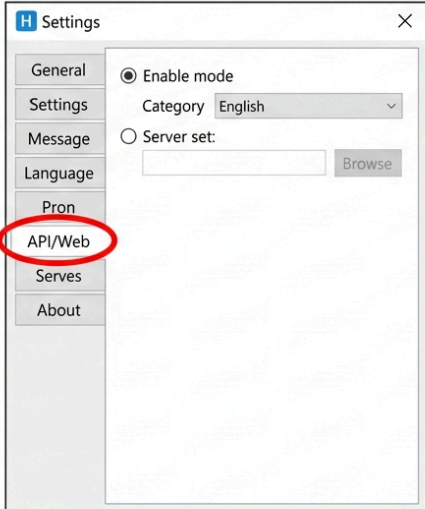

Step 3: Enable the API and Get Your Credentials

1. **Check ALL the checkboxes** you see in this panel (e.g., Enable API settings, Enable user HTP interfaces, etc.). This tells Holyrics to listen for external commands.
2. Look for the **Port** field — it usually shows a number like **8091**. Write this number down.
3. Look for the **Token** field — this is a long string of letters and numbers (like a password). **Copy this token** carefully (right-click → Copy, or Ctrl + C).

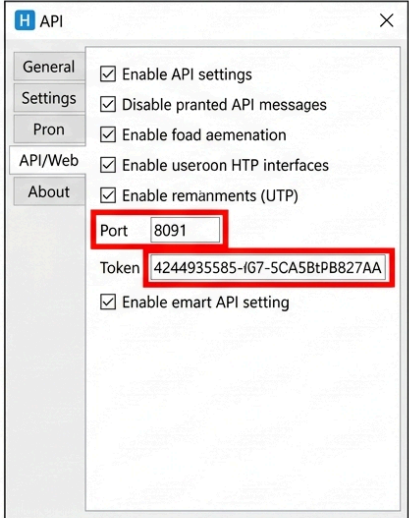

Step 1: File → Settings

Step 2: Click API/Web tab

Step 3: Check **ALL** boxes, Note Port & Token

4. Click **Save** or **OK** to close the settings

 **Tip:** The Token is case-sensitive. Make sure you copy it exactly as shown, with no extra spaces before or after it.

Step 4: Enter the Credentials in Corpus Engine

1. Go back to Corpus Engine in your Chrome browser
2. Click the  **Settings** button (gear icon) in the top-right area
3. Scroll down until you find the **Integrations** section
4. Find the **Holyrics Connection** toggle and switch it **ON**
5. Fill in the following fields:

Field	What to Enter
IP Address	127.0.0.1 (if same computer) or the IP address you found earlier (e.g., 192.168.1.105)
Port	The port number from Holyrics (usually 8091)
Token	The token string you copied from Holyrics

6. Click **Save Settings**

Step 5: Test the Connection & View Communication Panel

- 1. Make sure Holyrics is running and a presentation is open
- 2. In Holyrics, look at the main screen and find the **Communication Panel** (usually on the right side or bottom, labelled "Communication" or "Messages"). This panel receives messages from Corpus Engine.
- 3. In Corpus Engine, say "*John 3:16*" into your microphone (or type it)
- 4. When the scripture card appears in the Staging Queue, click **PUSH LIVE**
- 5. **Confirmation:** The verse should instantly appear in the Holyrics Communication Panel, and if a presentation is active, it will push directly to your projection screen!

✓

If it works, congratulations! Corpus Engine is now connected to Holyrics.

Common Holyrics Errors and Solutions

Error	Cause	Solution
"Connection Refused"	The API is not enabled in Holyrics, or the wrong port was entered	Go back to Holyrics Settings → API/Web and make sure all boxes are checked. Double-check the port number.
"Unauthorized"	The token you entered in Corpus Engine doesn't match the one in Holyrics	Go back to Holyrics, copy the token again very carefully, and paste it into Corpus Engine settings. Make sure there are no extra spaces.
"Network Error"	The two computers are not on the same WiFi network	Connect both computers to the exact same WiFi network and try again.

7. PART B: Connecting Corpus Engine to vMix

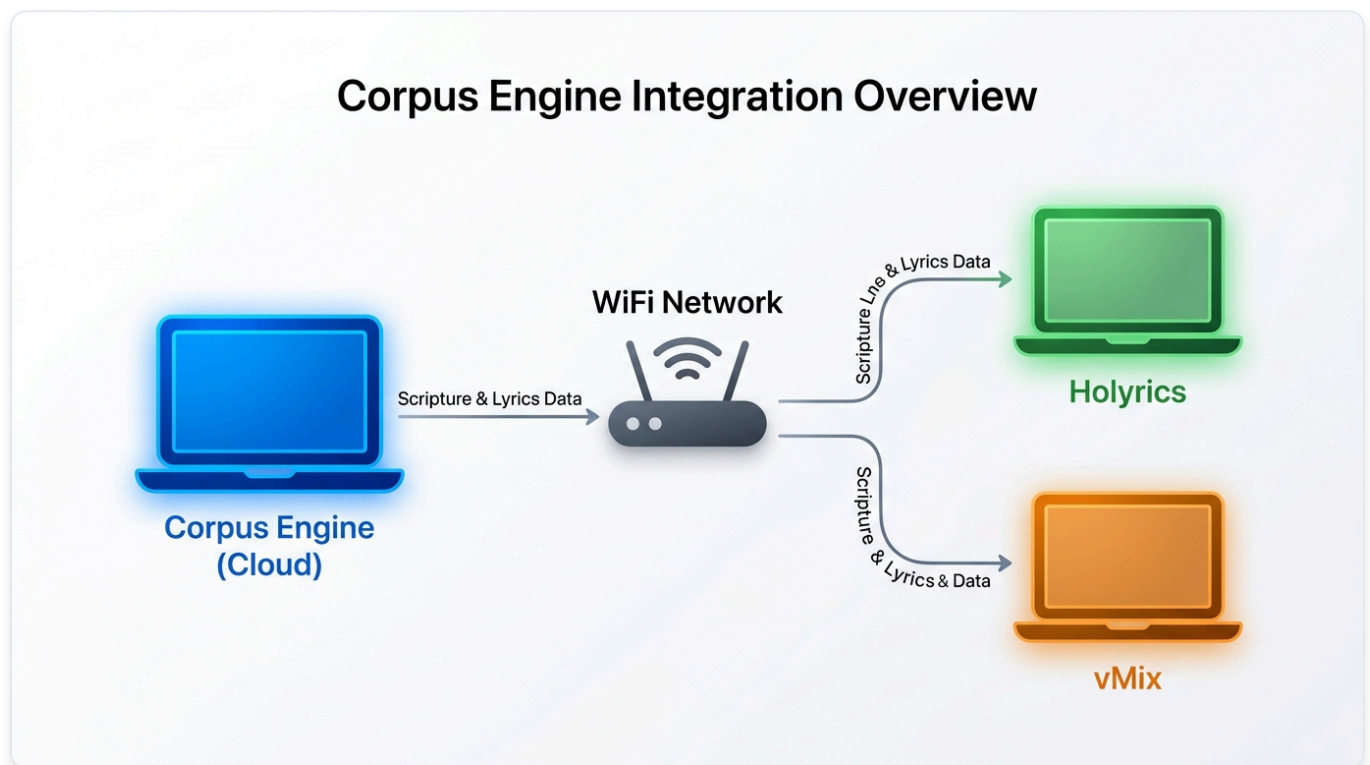

{#connecting-to-vmix}

This section covers the **complete end-to-end process** of connecting Corpus Engine to **vMix** so that pushed scriptures and lyrics appear directly in your vMix title graphics on the broadcast output.

Understanding How vMix Integration Works

Unlike Holyrics (which handles its own projector screen), vMix is a **video production switcher**. It uses "Title" inputs (also called "Lower Thirds") that overlay text on top of your camera feeds. Corpus Engine sends the scripture text directly into a specific text field inside your vMix Title input.

Here's the overall flow:

PHASE 1: Prepare vMix — Add a Title Input

Before Corpus Engine can send text to vMix, vMix needs to have a **Title Input** ready to receive it.

Step 1: Open vMix

Launch vMix on the computer that handles your live broadcast video mixing.

Step 2: Add a Title Input

1. Look at the very bottom of the vMix window
2. Click the **"Add Input"** button (it has a "+" icon)
3. From the menu that appears, click **"Title / GTXD"**
4. A file browser window will open. Navigate to the vMix Titles folder (usually at C:\Program Files (x86)\vMix\titles\GT\Lower Thirds\)
5. Select a template you like (for example, **Element Blue**) and click **Open**

The Title input will now appear as a new input at the bottom of your vMix window (e.g., **Input 1**).

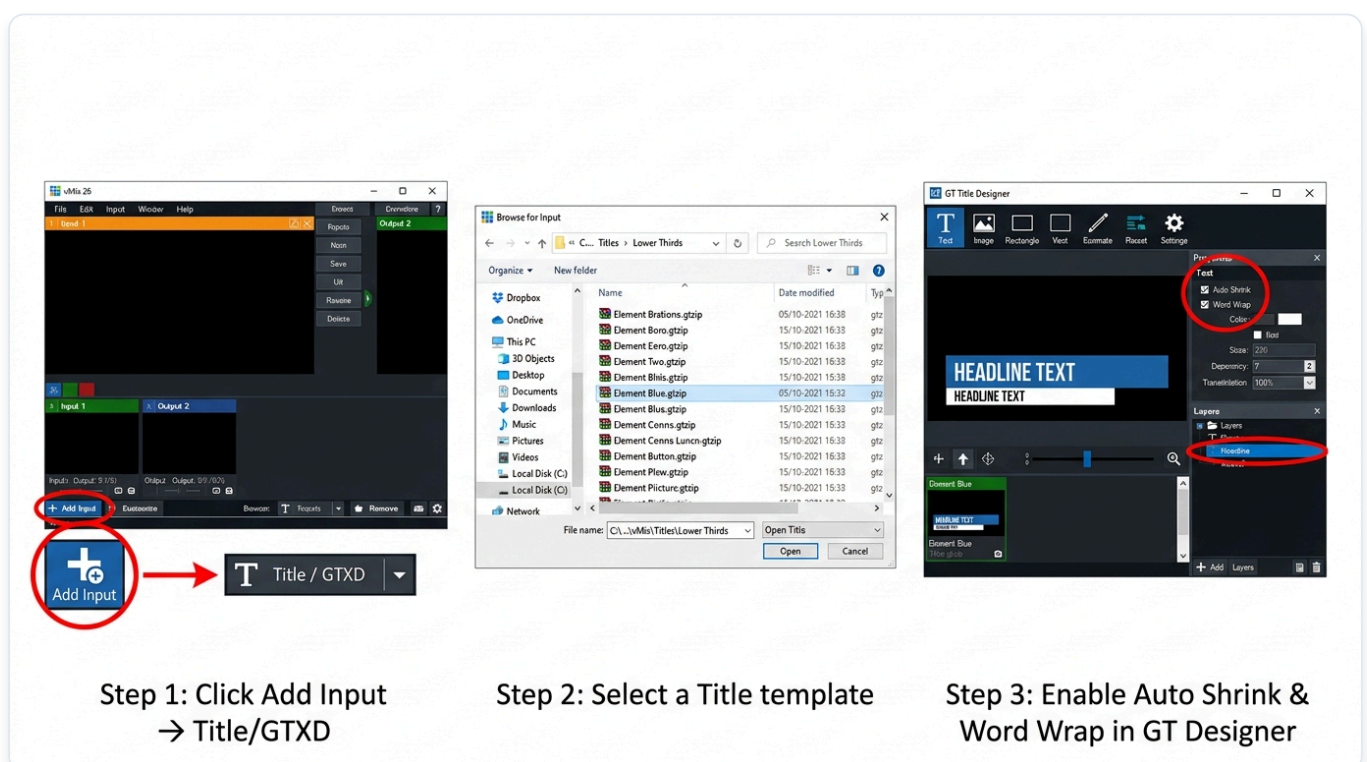

Step 3: Note the Input Number

Look at the **number** displayed on the input thumbnail at the bottom of vMix. This number (e.g., **1, 2, 3**) is what you will enter into Corpus Engine later.

💡 **Important:** Use just the **number** (e.g., **1**), not the name (e.g., "Title 1 - Element Blue.gtzp"). The number works more reliably.

PHASE 2: Configure the Title in GT Designer

The default vMix titles have a fixed text box that cannot handle long scriptures. The text will get cut off. We need to fix this by enabling **Auto Shrink** and **Word Wrap**.

The image contains three screenshots illustrating the steps to configure a title in vMix and GT Designer.

Step 1: Click Add Input → Title/GTXD

The first screenshot shows the vMix 25 interface. At the bottom, the "Add Input" button (a blue square with a white plus sign) is circled in red. An arrow points from this button to a dropdown menu that is open, showing "Title / GTXD" as the selected option.

Step 2: Select a Title template

The second screenshot shows a "Browse for Input" file explorer window. The address bar shows "C:\Titles\Lower Thirds". The file list shows several .gtzp files, with "Element Blue.gtzp" selected and highlighted in blue.

Step 3: Enable Auto Shrink & Word Wrap in GT Designer

The third screenshot shows the GT Title Designer interface. On the right side, the "Text" properties panel is open. The "Auto Shrink" and "Word Wrap" checkboxes are both checked and circled in red. Below this, the "Headline" text box is also circled in red.

Step 1: Open the GT Title Designer

1. Press the **Windows Start** button on your keyboard
2. Type "**GT Title Designer**" in the search bar
3. Click on the application called **vMix GT Title Designer** (it has a blue "GT" icon)
4. This opens a completely separate design application (it looks like a simple graphic design tool)

Step 2: Open Your Title Template

1. In the GT Title Designer, click **File → Open**
2. Navigate to the same folder where vMix titles are stored (C:\Program Files (x86)\vMix\titles\GT\Lower Thirds\)
3. Open the same template you added to vMix (e.g., Element Blue)

Step 3: Select the Headline Text Layer

1. On the **right side** of the GT Designer window, you will see a list of layers (Text, Headline, Description, etc.)
2. Click on the layer called "**Headline**" — this is the main text field where Corpus Engine will write the scripture text
3. When you click it, you should see the text box highlighted in the design area

Step 4: Enable Auto Shrink and Word Wrap

1. With the **Headline** layer selected, look at the **top menu ribbon**
2. Click the **Home** tab
3. In the Text section of the ribbon, find and **check** these two boxes:
 - ☒ **Auto Shrink** — This makes the text automatically get smaller if the verse is too long to fit
 - ☒ **Word Wrap** — This makes long text wrap to the next line instead of running off the edge

Step 5: Save Your Modified Title

1. Click **File → Save As**
2. Give it a new name like "**Corpus Engine Title**" or "**Scripture Lower Third**"
3. Save it in the same Titles folder

Step 6: Add the Modified Title to vMix

1. Go back to your main vMix window
2. If you already have the old title, right-click it and select **Remove**
3. Click **Add Input → Title / GTXD** again

4. This time, select your newly saved "**Corpus Engine Title**" file
 5. It will appear as a new input. Note the input number.
-

PHASE 3: Enable the vMix Web Controller

The vMix Web Controller is a built-in feature that allows other software (like Corpus Engine) to send commands to vMix over the network. It needs to be turned ON.

Step 1: Open vMix Settings

1. In vMix, click **Settings** in the top-right corner of the main window

Step 2: Enable the Web Controller

1. In the Settings window, click on the **Web Controller** tab
2. Make sure it says "**Running**" or there is an "**Enable**" button you can click
3. The default port is **8088**. Do not change this unless you have a specific reason to.
4. Click **OK** to save

Step 3: Find the vMix Computer's IP Address (If on a Different Computer)

If vMix is on a **different computer** from the one running Corpus Engine:

1. On the **vMix computer**, press **Windows key + R**
2. Type `cmd` and press Enter
3. Type `ipconfig` and press Enter
4. Find the **IPv4 Address** (e.g., `192.168.1.108`)
5. Write this down

If vMix is on the **same computer** as Corpus Engine, use `127.0.0.1` .

PHASE 4: Configure Corpus Engine's vMix Settings

Step 1: Open Corpus Engine Settings

1. In Corpus Engine (in your Chrome browser), click the  **Settings** button
2. Scroll down to the **Integrations** section

Step 2: Enable vMix and Enter Credentials

1. Find the **vMix Connection** toggle and switch it **ON**
2. Fill in the following:

Field	What to Enter
IP Address	127.0.0.1 (same computer) or the IPv4 address of the vMix computer (e.g., 192.168.1.108)
Input	The input number of your Title in vMix (just the number, e.g., 1)

3. Click **Save Settings**

PHASE 5: Test the vMix Connection

1. Make sure vMix is running and your Title input is visible
2. In Corpus Engine, type or say a scripture reference like "John 3:16"
3. When the card appears in the Staging Queue, click **PUSH LIVE**
4. The scripture text should instantly appear inside the Headline text field of your vMix Title!

✅ If the text appears in vMix, the connection is working perfectly.

8. Browser Security Settings (CRITICAL) {#browser-security}

Why This Step is Necessary

Corpus Engine runs on a **secure cloud server** (HTTPS). However, Holyrics and vMix run on your **local computer** or **local network** (HTTP — without the "S"). Modern web browsers like Chrome have a security rule called "**Mixed Content**" that automatically **blocks** secure websites from talking to insecure local devices.

This means that even if you enter all the correct IP addresses and tokens, **Chrome will silently block the connection** unless you explicitly tell it to allow this.

⚠️ **This is the #1 reason why the connection fails.** If nothing is happening in Holyrics or vMix when you push a verse, this is almost certainly the cause.

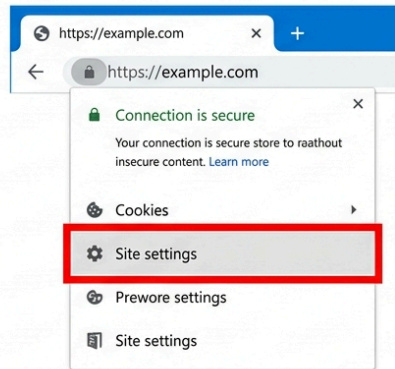

How to Allow Insecure Content in Google Chrome

STEP 1

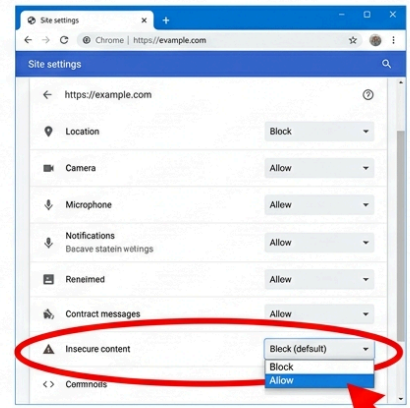

1. Click the **padlock** icon

STEP 2

2. Click **Site settings**

STEP 3

3. Change to **Allow**

Step 1: Click the Padlock Icon

1. Look at the **address bar** at the very top of Chrome (where the website URL is displayed)
2. On the **far left** of the address bar, you will see a small **padlock icon** (🔒) or a **tune/slider icon**
3. **Click** on that icon

Step 2: Open Site Settings

1. A small dropdown menu will appear
2. Click on **"Site settings"** (it usually has a gear icon next to it)
3. A brand new Chrome tab will open showing all the permission settings for the Corpus Engine website

Step 3: Change Insecure Content to "Allow"

1. **Scroll down** the list of permissions until you find **"Insecure content"**
2. Click the dropdown box next to it — it will say **"Block (default)"**
3. Change it to **"Allow"**

Step 4: Refresh the Page

1. Close the settings tab and go back to the Corpus Engine tab
2. Press **Ctrl + Shift + R** (hard refresh) to reload the page with the new permissions
3. Your vMix and Holyrics connections should now work!

⚠️ **Note:** You only need to do this once per browser. However, if Chrome updates or you clear your browser data, you may need to repeat this step.

If You Are Using Brave Browser

Brave has an additional security layer called "Shields." To allow the connection:

1. Click the **Lion icon** in the address bar
2. Toggle the switch to **turn Shields DOWN** for this site
3. Then also follow the Chrome steps above to allow Insecure Content

Optional: Installing a CORS Extension (For Holyrics on a Second Computer)

If Holyrics is running on a **separate computer** and you encounter additional connection issues, you may need to install a **CORS (Cross-Origin Resource Sharing) extension** in Chrome. CORS is a browser security policy that prevents websites from making requests to different servers. The extension relaxes this rule.

How to Install

1. Open Chrome and go to the Chrome Web Store: <https://chrome.google.com/webstore>
2. Search for "**Allow CORS: Access-Control-Allow-Origin**"
3. Click "**Add to Chrome**"
4. Once installed, you will see a small icon in your Chrome toolbar (top right)
5. Click the icon and make sure it is **toggled ON** (it usually turns from grey to coloured)

💡 **When is this needed?** Only when Holyrics is on a different computer and Chrome is blocking the requests even after you've allowed Insecure Content. For vMix, the Insecure Content setting alone is usually sufficient.

9. Going Live on Sunday Morning {#going-live}

Here is your complete checklist for a successful live broadcast with Corpus Engine:

Pre-Service Setup (15 minutes before)

Step	Action	
1	Turn on all computers and connect them to the same WiFi network	☐
2	Open Holyrics on the projection computer and verify it is running	☐
3	Open vMix on the broadcast computer and verify your Title input is loaded	☐
4	Open Google Chrome and navigate to Corpus Engine	☐
5	Log in to your Corpus Engine account	☐
6	Verify the " Connected " indicator shows green in the top bar	☐
7	Click  Settings and verify your Holyrics IP, Port, and Token are correct	☐
8	Verify your vMix IP and Input number are correct	☐
9	Check that Chrome's Insecure Content is set to "Allow" (see Section 8)	☐
10	Click  Audio: ON and allow microphone permission when prompted	☐
11	Do a quick test — say " <i>Psalm 23:1</i> " into the microphone	☐
12	Verify the verse appears in the Staging Queue	☐
13	Click PUSH LIVE and verify it appears in Holyrics/vMix	☐

During the Service

- **Watch the Staging Queue** for detected scriptures and songs
- **Click PUSH LIVE** on each card when you're ready to display it
- Use the **Bible tab (Ctrl + B)** to manually find and push specific verses
- Use the **Lyrics tab (Ctrl + L)** to browse and push saved song lyrics
- Use **Arrow Keys** to navigate between sections in lyric cards
- Click **CLEAR SCREEN** when you want to remove the current display

After the Service

- Click  **End Session** if you started a recording session
 - Click  **Audio: OFF** to stop listening
 - Log out or simply close the browser tab
-

10. Troubleshooting & FAQ {#troubleshooting}

"Nothing is happening in vMix when I push a verse"

Cause: Chrome is blocking the connection due to Mixed Content security.

Solution:

1. Click the padlock icon in the address bar → Site Settings → Insecure Content → Allow
2. Refresh the page with Ctrl + Shift + R
3. Try pushing again

"Holyrics says Unauthorized"

Cause: The API token in Corpus Engine doesn't match the one in Holyrics.

Solution:

1. Open Holyrics → File → Settings → API/Web tab
2. Copy the Token very carefully (no extra spaces)
3. Paste it into Corpus Engine's Settings → Holyrics Token field
4. Save and try again

"The microphone is not picking up audio"

Cause: Chrome's microphone permission may have been denied or reset.

Solution:

1. Click the padlock icon in the address bar → Site Settings
2. Find **Microphone** and set it to **Allow**
3. Refresh the page and click Audio: ON again

"The text is getting cut off in vMix"

Cause: The vMix Title text box doesn't have Auto Shrink or Word Wrap enabled.

Solution:

1. Open the **GT Title Designer** application (search for it in the Windows Start menu)
2. Open your title template (File → Open)
3. Click the **Headline** layer on the right side
4. Go to the **Home** tab and check **Auto Shrink** and **Word Wrap**
5. Save the file and reload it in vMix

"Scriptures are not being detected"

Cause: Audio might not be reaching the system, or the AI engine might be off.

Solution:

1. Make sure **Audio: ON** is toggled (you should see it highlighted green)
2. Make sure **AI: ON** is toggled for paraphrased scriptures
3. Speak clearly into the microphone
4. If using an external audio source (mixing desk), make sure the AUX output is connected

"Songs are not found when I search"

Solution:

- Use the format: "**Song Title - Artist Name**" (e.g., "*Way Maker - Sinach*")
 - If the song is very new or regional, it might not be in the lyrics database. You can manually type and save lyrics.
-

Summary

Corpus Engine transforms the way churches handle live media. By automating scripture detection, song lyric fetching, and direct integration with broadcast tools like Holyrics and vMix, it:

-  **Reduces your media workforce** from 3 people to 1
-  **Eliminates human error** in scripture display
-  **Speeds up response time** from 60 seconds to under 1 second
-  **Enhances broadcast quality** with perfectly formatted, instant lower thirds
-  **Syncs your settings** across any computer via the cloud
-  **Works with your existing tools** — no need to replace Holyrics or vMix

Welcome to effortless live broadcasting. ✨

Document prepared for Corpus Engine clients. For support, contact your Corpus Engine administrator on WhatsApp at +2348124580183, or via email at johnson@ronimationstudios.com.
